As we have entered the digital age, business has been handled over apps and websites in recent years.

How did people function before the Internet?

- Conversations happened in-person or over the phone.
- Information was read prior to making decisions, rather than reacting to news.
- Physical infrastructure was relied upon.

So what happened? How did it all begin?

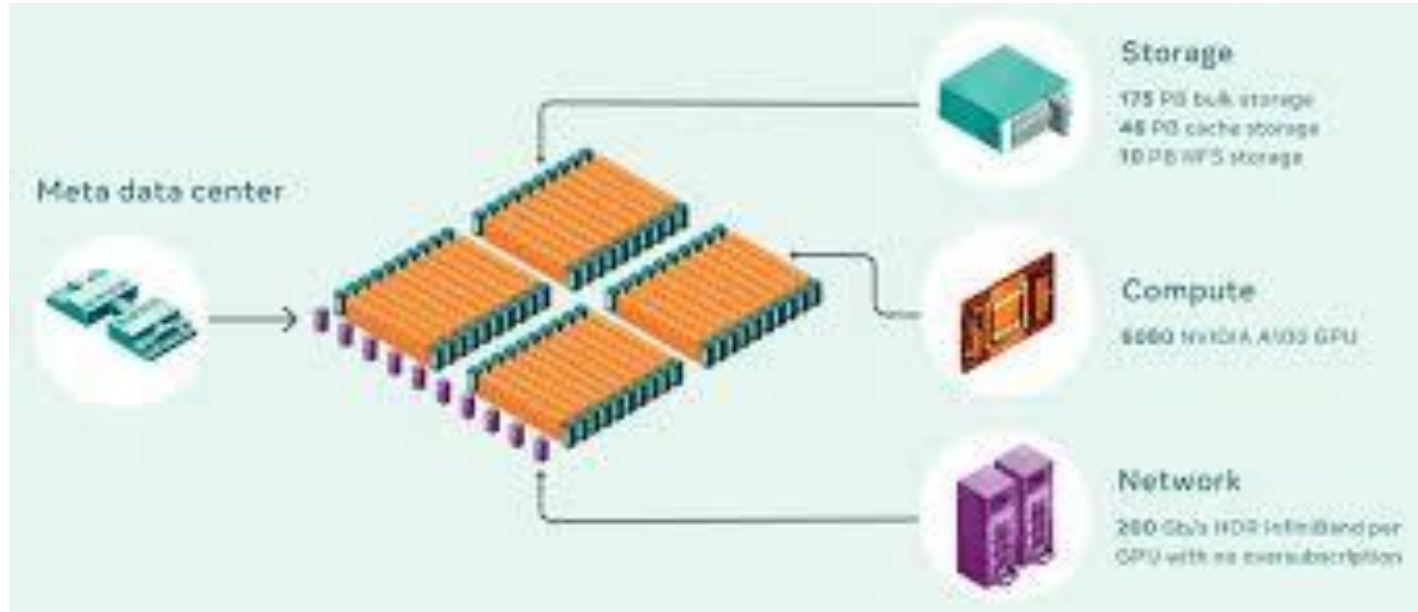

- Ray Tomlinson was working for APRANAT; government funded research program that became the internet
- In 1971, Tomlinson created a program that allowed people to send messages between two computers on the APRANAT system.
- In other words, he invented email.

So what happened next?

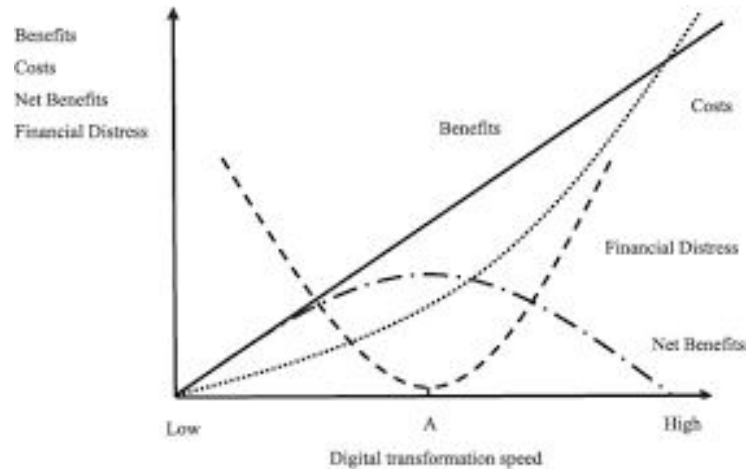

- IBM Simon was the first device termed as a “smartphone”, launched in the 1990s
- Included applications, such as email support, a calendar, a calculator, etc
- Social media expanded rapidly since its start in the late 1990s
- People of every demographic use social networking sites; 90% through mobile devices
- Online social media networking speeds along the purpose of email; communication

So what does *that* mean in the business world

- Currently, the Internet of Things (IoT) connects devices and appliances to collect and exchange data, via the Internet.
- Cloud computing is how remote servers store, manage, and process data.
- Cybersecurity is a major concern in business.

Is digital transformation worth it?

- Cybersecurity is a major concern in the business world, thanks to the digital transformation.
- 90% of all organizations are undergoing some transformation.
- Implementation and risk mitigation for 3 years is roughly \$637,500.
- Investment returns are \$2,090,400.
- This brings us a net gain of about \$1,452,900.
- So **yes**, *digital transformation is cost efficient, as well as our new networking, and therefore worth it.*
